

Lambda 60 has a cleaning handle as an option. The tubes is then cleaned maybe every third month instead of every third week.

1. Expansion & Flow
2. Return
3. Drain Cock

Effecta Lambda 60 kW

A real wood log boiler!

Effecta Lambda 60 is designed for the customer who has a bigger house or farm with a large energy consumption. The grate has a volume of an impressive 195 litres, which means that with only one filling, a huge amount of water is heated. This means fewer numbers of refilling the boiler and less time spent in the boiler room. Also the total efficiency of the system is better. Less startups makes the boiler work even better, it is in the start phase when the boiler is cold that the efficiency is lower and combustion less clean.

System solutions

At our factory in Kungsbacka we manufacture not only our boilers, but also the accumulator tanks.. This means that we know the whole system, and you as a customer can purchase products that are tested together and guaranteed to function together. Also if you are interested in solar energy as a compliment in your system, we have that knowledge as well the products for that.

Lambda sensor

Effecta Lambda 60 register and controls the combustion during the whole firing session. This means that the amount of pollutant in the smoke is down to a minimum. Of course the efficiency is very high, and one of the best things is that you get the same result everytime the boiler is used, no matter who is using it. The lambda control takes care of that.
